

# 4000 SERIES ALTERNATOR RE-DESIGN!

**NEW!**

Our high amperage alternators are being re-designed for tomorrow's applications!

- **The leader in high temperature designs!**

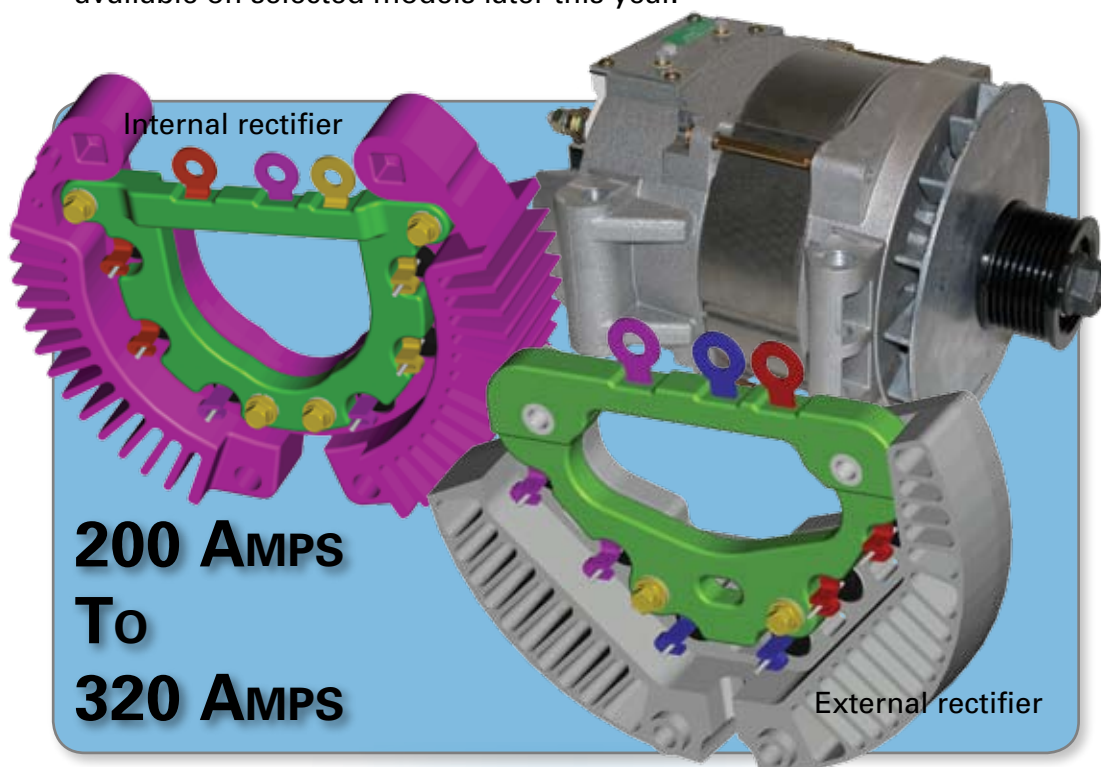

These design improvements will solidify our manufacturing processes and enhance the reliability of the entire line currently rated for applications up to **110°C**. Units approved for applications of up to **125°C** are under development and will be released later this year.

- **We can take the heat!**

The 2007 heavy duty diesel engines are running hotter than ever before. We know that the 2010 EPA requirements are going to drive those under-hood temperatures even higher. **We're going to be ready!**

- **Proven technology!**

The solid lead frame design, using high temperature avalanche diodes with welded connections is proven technology, and will be incorporated into all existing models. An advanced regulator design will allow for installation in severe high temperature environments of up to **125°C**, and will be made available on selected models later this year.
